

Handling Client Objections

Agent Performance

tl;dr relate everything to human agents and then show them how they can fix it themselves

Voice Problems

“not natural enough” “sounds rude” “doesn’t match our brand”

“keeps pronouncing our company name wrong”

Say

- **Acknowledge** any issues
- **Explain** that Poly Voices are the ones where we have the most control

Do

We have so many tools we can demo in **Agent Studio!**

Whether it’s **Response Control**, or **Audio Management** or even showing them how to run A/B tests in **Agent Voice** - this is something we can always object to well

Voice is our bread and butter - we believe high quality voice experiences is the key to gaining customer trust and fostering high performance. Therefore, our platform provides many tools for you to manage the Voices that you select, and give you a high level of control to optimise them for your calls.

Intent Accuracy

“it hallucinated” “why doesn’t it teach itself”

Say

- An LLM is a **Probabilistic model** that’s using the information it has available
- It’s designed to be **overly helpful**
- Human agents make mistakes too - often due to **not having enough information**, or the **instructions being unclear**

Do

- Raise any recurring issues internally - track these as **bugs** and avoid **hallucination** terminology
- Demonstrate **Topic Citations** in Agent Studio to provide reassurance around safety
- Educate on **Knowledgebase** management

Would you want a human agent to teach themselves, if they made a mistake? Or would you want to manage their training? Our Agent Studio platform enables you to manage and update all SOPs, just like with a human agent...

Speech Recognition

“keeps interrupting customers”

“not very good at collecting names”

“pauses are too long”

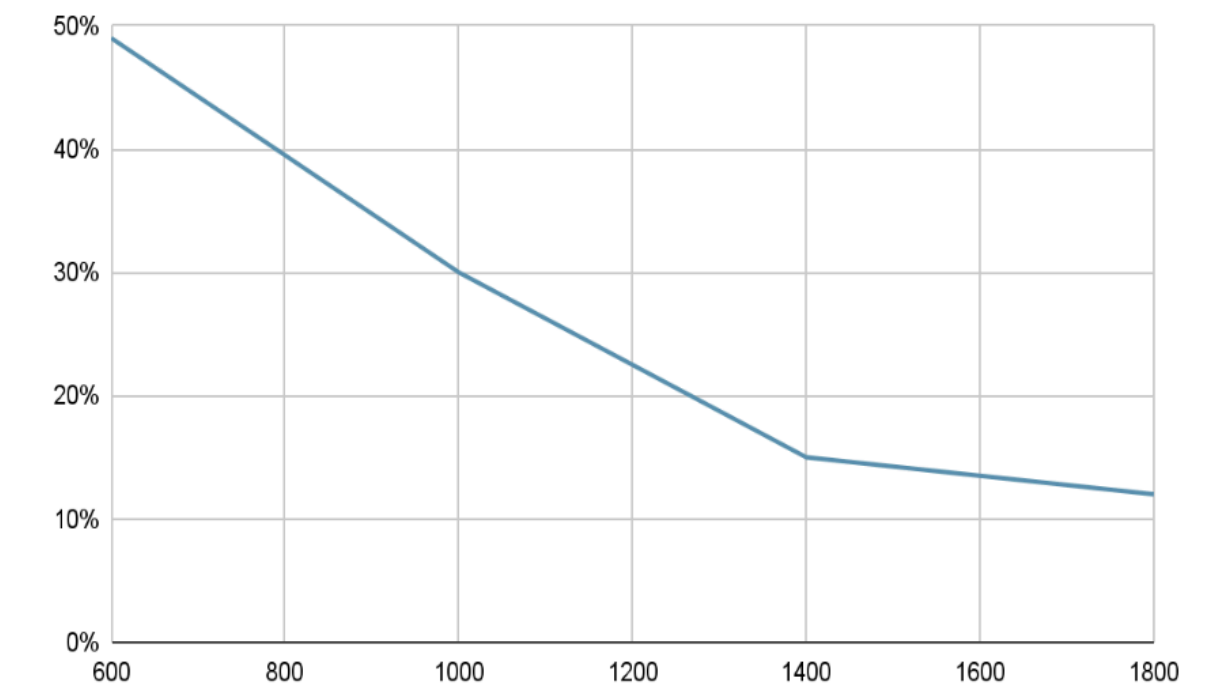

Say

- **Acknowledge** issues that have been raised, and ask for call reviews
- **Explain** about the trade off between latency and interruption
- If in UAT, **explain** that latency will improve due to **caching**

Do

- Gather **data points** using manual call review to **quantify** the issue
- If the concerns are valid, ensure that engineering have selected the **correct models**
- Agent Studio enablement in **Settings**
- **Highlight** strengths in agent recovery

Latency(ms) vs Interruption(%)

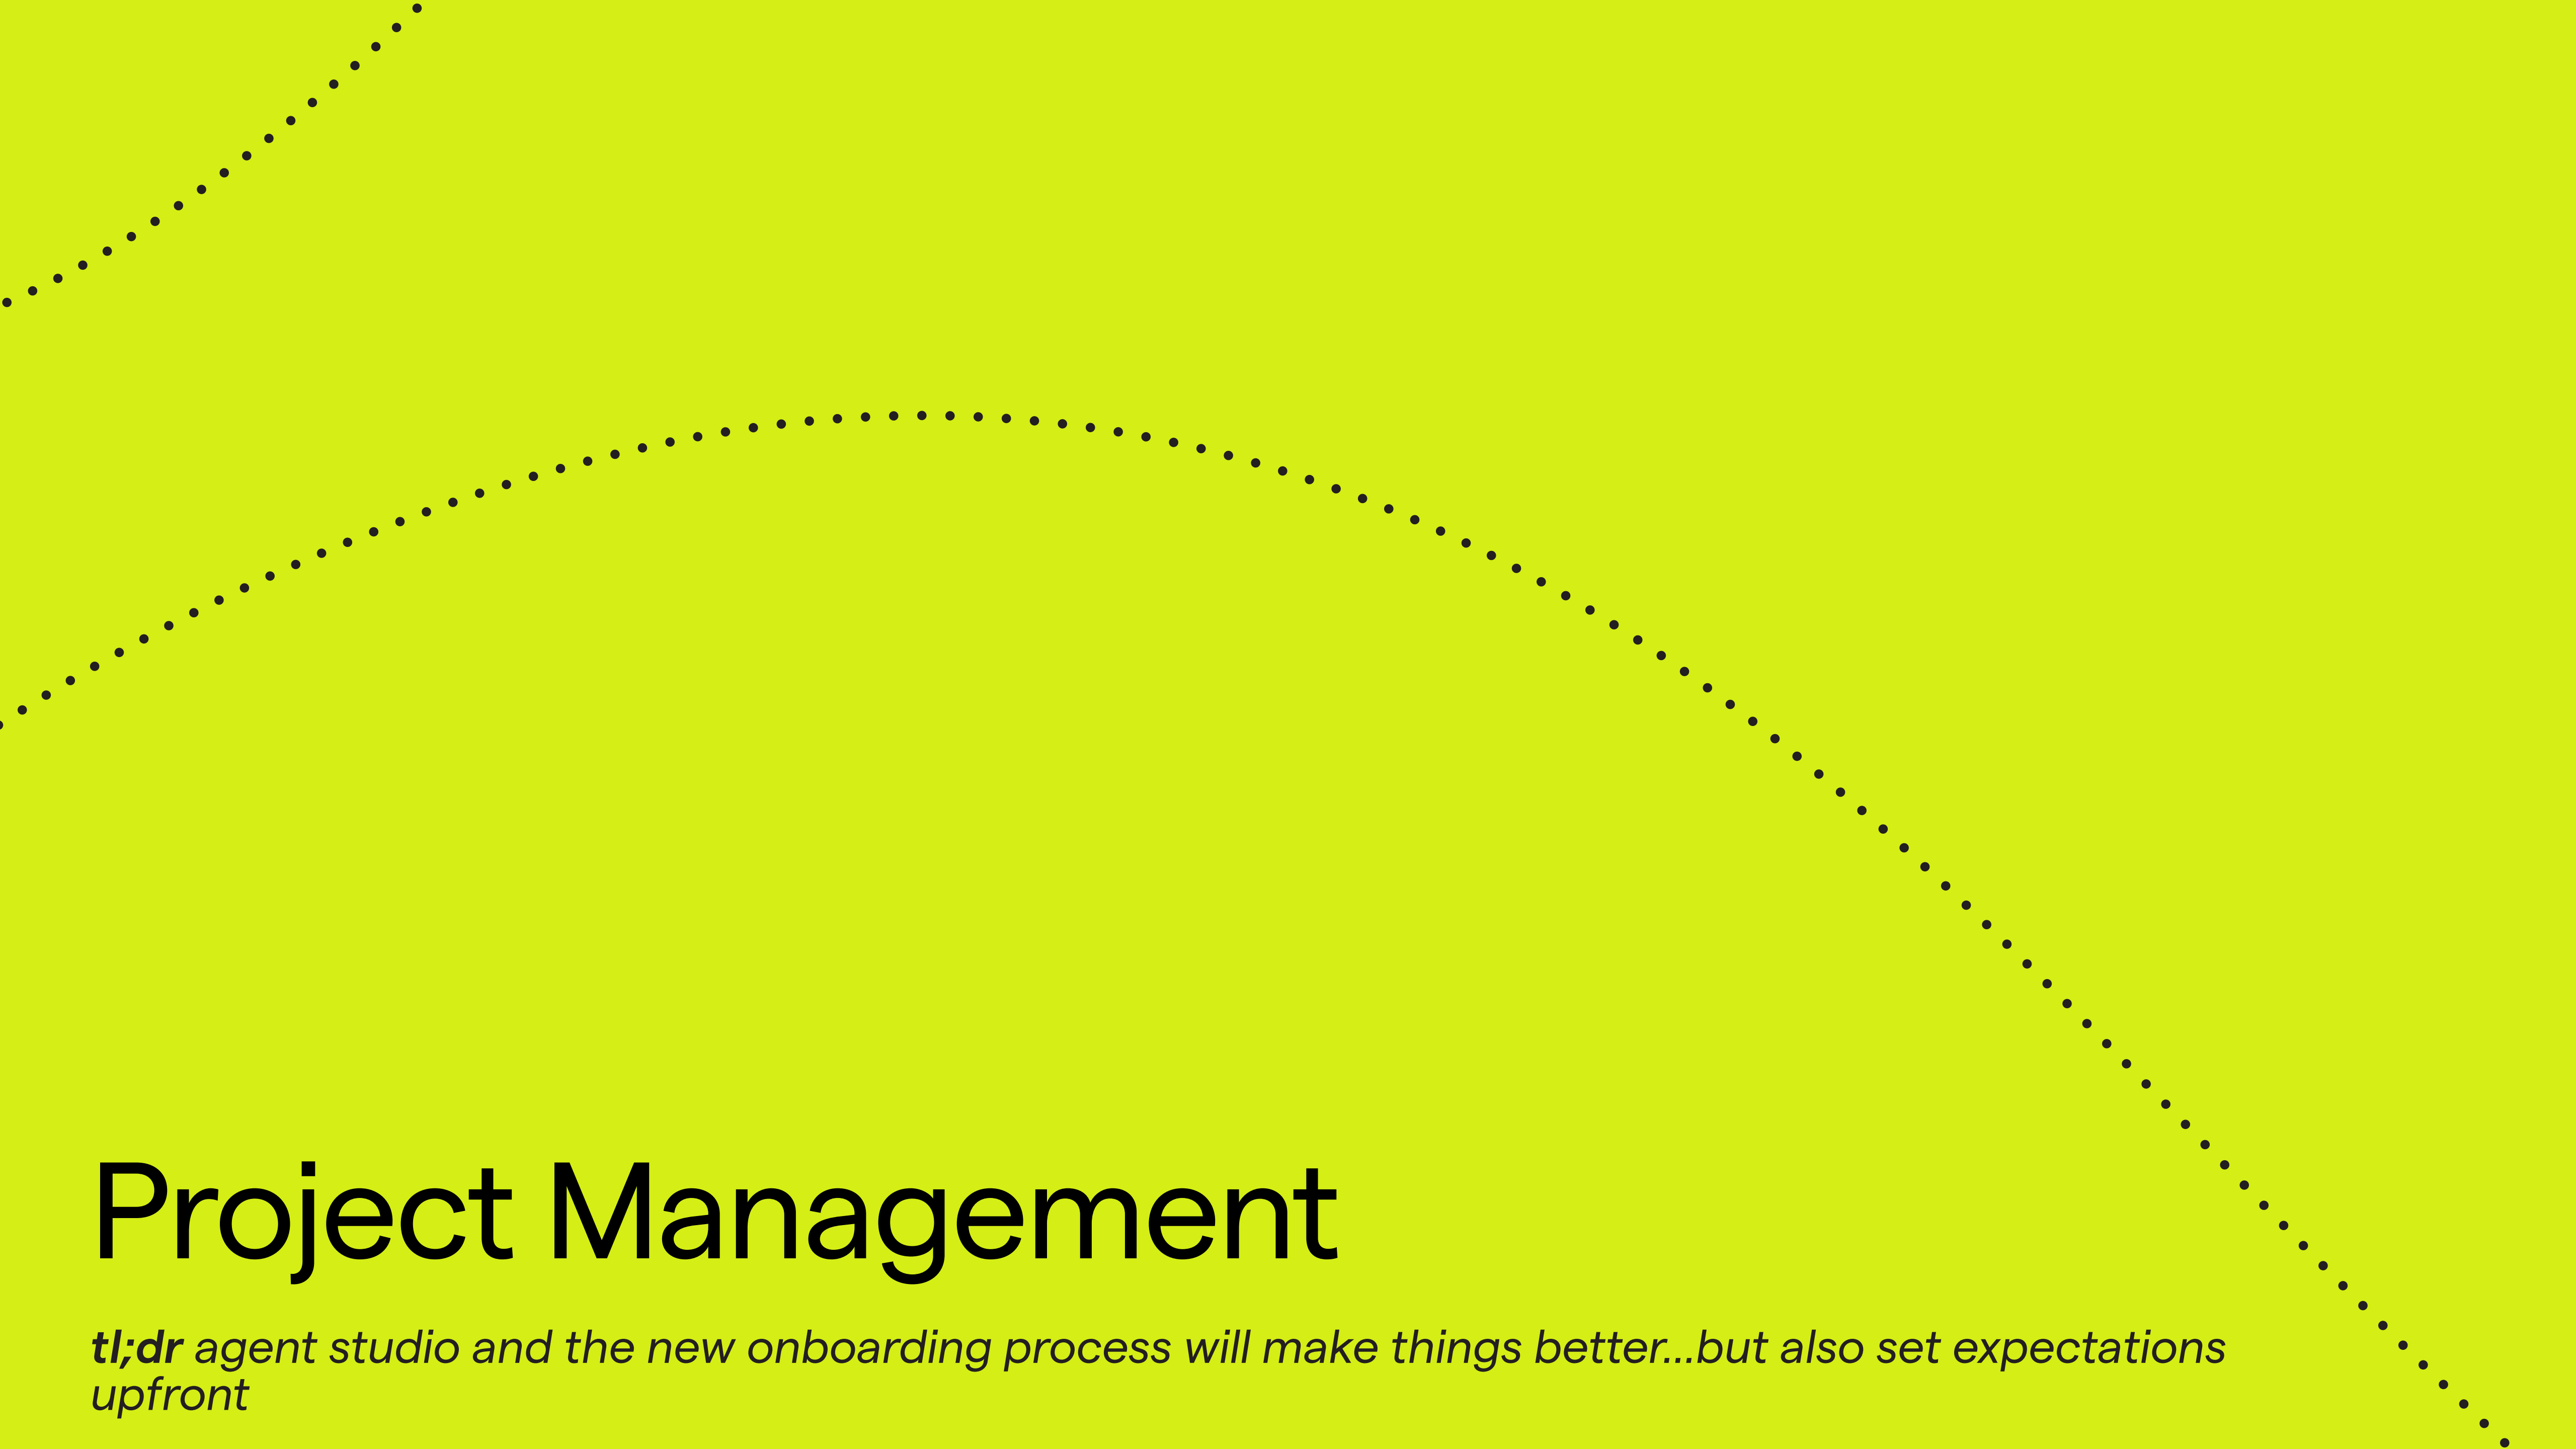

Latency and interruption rate trade-off curve based on real customer calls

Voice is an inherently noisy channel, and while our speech recognition models (developed with NVIDIA) are optimised for this, errors are inevitable. Poor signal quality, background noise, name variations (John vs Jon), and customers pausing all affect both humans and AI. This makes strong recovery essential - through allowing repetition, correction, and other fallback strategies. Our Agent Design team specialises in building these behaviours and can show you how.

Project Management

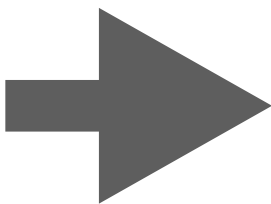

tl;dr agent studio and the new onboarding process will make things better...but also set expectations upfront

Issue Tracking

“here’s 400 calls we reviewed today, please fix all the issues”

15	Lengthen listening time for policy number		Bug		
16	Improve postcode collection accuracy		Bug		

But Also...

Agent Studio

And our new [customer onboarding](#) process

Success

tl;dr tie everything to the business objectives and ROI

Containment

“it’s not containing enough calls”

“that’s not a contained call - nothing valuable happened”

Ask

External: How do you define Containment?*

*Especially with past vendors

Internal: What does their business case require?

Do

Accommodate: If customers are refuting abandons as “Contained”, then use a definition of containment that accommodates them but also favours us - e.g. Contained, minus calls less than X seconds*

* Unless there is a specific definition we need to match, in accordance with other vendors etc.

Upsell: If the use case is just FAQs, it will not get more than 15-20% Containment. Higher containment will be achieved through integrated use cases. Use this as an opportunity to talk about future use cases

Additional Success Measures

“here is another arbitrary success measure I’ve created mid-rollout”

Questions to Ask

External: How does this relate to your high level business objectives?

Internal: Does this directly relate to the business case or to their overall ROI?

Overall business objectives should be defined upfront, during kick-off. All success metrics should relate to these business objectives, and you can push back carefully by inquiring about this. Sometimes - you may need to accommodate additional success metrics, but this needs to be justified by core business need.
